

KPI Cards

Revenue (\$) per Genre

Direction: Higher the better.
The Action genre had the highest avg revenue with \$54369.11 followed by Adventure, with roughly \$53300, RPG, with \$52100 and the rest. Evidently, the Action and RPG genres are deemed very profitable.

Stream Viewership per Genre

Direction: Higher the better.
The stream viewership avg for FPS is considerably higher than the rest with about 78999 views, while the second best, RPG, has only about 74000 views. FPS mechanics are a must have for attention.

Session Duration (min) per Genre

Direction: Higher the better.
Simulation games have had the longest historical engagement times with an average of 59.27 minutes.

Revenue (\$) per Platform

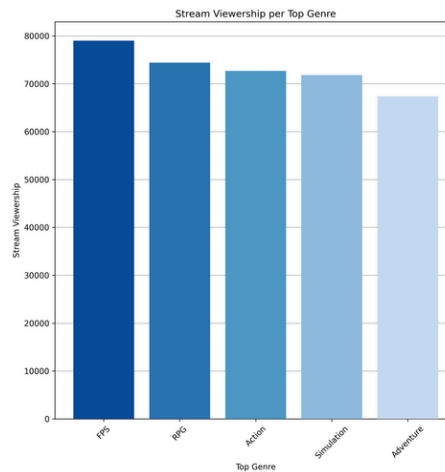

Direction: Higher the better.
On average, PC remains the most profitable with about \$59519.66 on avg, which is much better than the second best, Console, at only about \$53088. This results in our game being designed for PC.

Mechanic Specs:

Mechanic Spec	Value	KPI reference
Chess AI Time	Max time = 15 sec and AI depth level > 3	Session Duration - a long and intensive AI will ensure a long match.
FPS Shot	Time limit = 5 sec	Stream viewership - short time ensures high pressure streams that will be popular.
Ability Advancements	Extra-Queens (1 per dragon tamed)	The RPG aspect lies on a progressing character that is earned by taming dragons.
PC Controls	Raw Input = True (Mouse) and WASD speed = 4.5px/frame	Enables the mouse to be properly used for games that are on PC (as PC is most profitable).

Graphs

Stream Viewership (2024)

Revenue Trend (2010-2024)

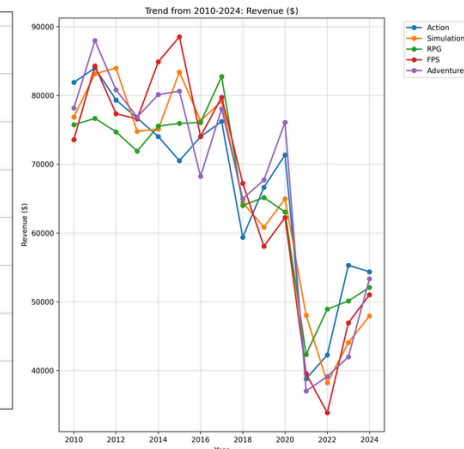

Table:

KPI Name	Insight	Game Mechanic + Explanation of Mechanic
Revenue (\$) per Genre	Action and RPG are earning the most in recent years (2024) with over \$54k on average.	Dragon Taming and power-ups are the game mechanic. When the player beats the dragon via shooting at a 20px target, the player gets to tame the dragon and gain certain abilities and power-ups.
Stream Viewership per Genre	FPS mechanics generate more than 3000 more views than other genres.	The player can capture enemy pieces by shooting them, adding an FPS element where each piece must be hit within 5-35 seconds depending on the selected difficulty.
Revenue (\$) per Platform	PC performs the best game-wise as it provides a major share of the money earned via games.	The game will be designed to run on the PC, optimized to run on it, and use the controls of a keyboard (WASD - pygame) to allow the player to move. Also, the controls will include other keyboard and mouse inputs to make the game optimized and enjoyable to every player.
Session Duration (min) per Genre	Simulation has the highest historical engagement times over 14 years, and is currently rising with the rest of the genres.	The game mechanic will be chess battles against a computer opponent. These long battles will leverage the long retention rates.

Game Pitch Box:

Genre: Action-RPG / Simulation Hybrid (the best of each genre is included in the game).
The game is based on the favorable aspects that the KPIs show, including a 3D maze, where the player's goal is to defeat the final boss dragon by winning against weaker computer-controlled competitors in chess games (simulation), or through an FPS experience that allows you to capture pieces by shooting them, or a mix of both. The controls will include WASD or the arrow keys to move (as the platform is PC) and mouse movement to change camera perspective, as well as left click to shoot. Also, the player loses after losing 3 lives (3 battles of chess against the dragons or losing the taming minigames). Scoring is based on how many deaths occurred, how many dragons, of what difficulty, tamed, and overall success (defeating the boss) or failure (losing all three lives). We used the simulation data to account for engaging battles and action/RPG data to design for a collection loop where the player makes the choices.
